MC10EP51, MC100EP51

3.3V / 5V ECL D Flip-Flop with Reset and Differential Clock

The MC10/100EP51 is a differential clock D flip–flop with reset. The device is functionally equivalent to the EL51 and LVEL51 devices.

The reset input is an asynchronous, level triggered signal. Data enters the master portion of the flip–flop when the clock is LOW and is transferred to the slave, and thus the outputs, upon a positive transition of the clock. The differential clock inputs of the EP51 allow the device to be used as a negative edge triggered flip-flop.

The differential input employs clamp circuitry to maintain stability under open input conditions. When left open, the CLK input will be pulled down to V_{EE} and the $\overline{CLK}$ input will be biased at $V_{CC}/2$.

The 100 Series contains temperature compensation.

- 350 ps Typical Propagation Delay
- Maximum Frequency > 3 GHz Typical
- PECL Mode Operating Range: V_{CC} = 3.0 V to 5.5 V with V_{EE} = 0 V
- NECL Mode Operating Range: V_{CC} = 0 V with V_{EE} = –3.0 V to –5.5 V
- Open Input Default State
- Safety Clamp on Inputs

PIN DESCRIPTION

PIN	FUNCTION
CLK*, $\overline{CLK}$*	ECL Clock Inputs
Reset*	ECL Asynchronous Reset
D*	ECL Data Input
Q, $\overline{Q}$	ECL Data Outputs
V_{CC}	Positive Supply
V_{EE}	Negative Supply

* Pins will default LOW when left open.
